Prepared By

Jairo Guevara, FIT Chemical Engineer

Region VI

Ecology and Environment, Inc.

November 16, 1989

PREFACE

This Screening Site Inspection (SSI) was prepared by Ecology and Environment, Inc. for the Environmental Protection Agency under Contract Number 68-01-7347 as part of an EPA Headquarters Test Study.

1. INTRODUCTION .

The Ecology and Environment, Inc. (E & E) Region VI Field Investigation Team (FIT) was tasked by the U. S. Environmental Protection Agency (EPA) under Technical Directive Document (TDD) F-06-8905-68 to conduct the Screening Site Inspection (SSI) of the Jensen Drive Drum site in Houston, Harris County, Texas.

1.1 SCREENING SITE INSPECTION OBJECTIVES

The SSI evaluates the potential risks associated with hazardous waste generation, storage and disposal at the site. It expands upon data collected during the Preliminary Assessment (PA) and identifies data gaps. Information obtained during the SSI supports the management decision of whether the site proceeds to the Listing Site Inspection (LSI) or receives the classification of No'Further Action under SARA.

The on-site reconnaissance inspection and new information from the EPA site clean-up were used to complete the investigation of the site before a decision was made regarding the necessity of a sampling inspection.

1.2 SITE DESCRIPTION AND HISTORY

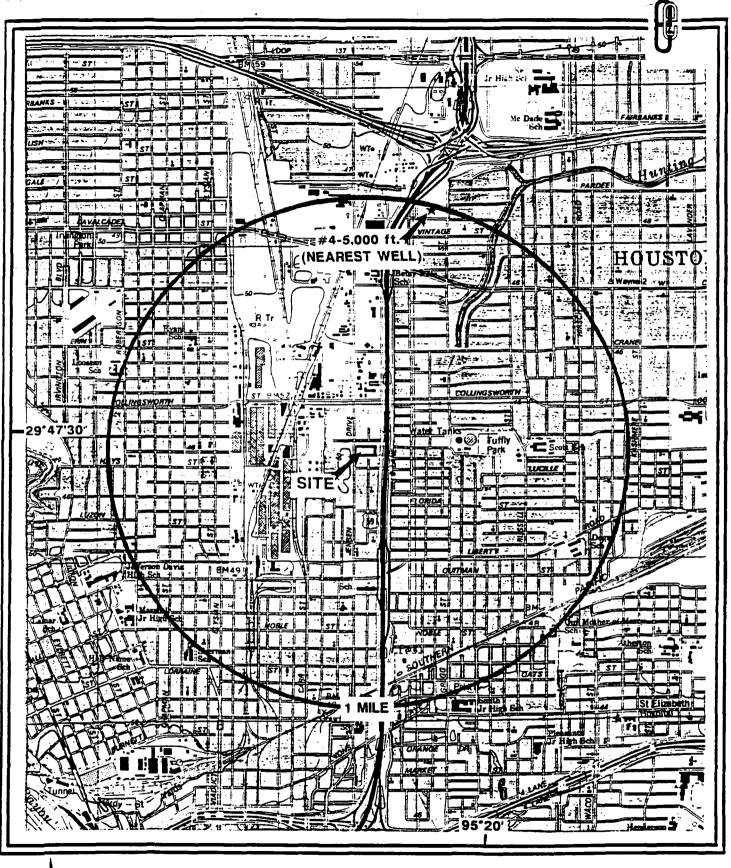

The Jensen Drive Drum site is located at 3116 Jensen Drive Northeast, Houston, Texas 77026 (Reference 1, Pages 3 and 32). The geographic coordinates are 29°47′25" north latitude and 95°20′29" west longitude (Reference 2 and Figure 1). The property is under the name of Leas-It, Inc., which is owned by Ronald J. Gray of Lufkin, Texas (home telephone: work telephone: 409/829-2282). The site encompasses 1.465 acres, approximately 400 feet wide by 150 feet long, and is located in a light industrial and residential area (Reference 2 and Figure 2). Mr. Gray apparently leased his land to Mr. Fred Winston, (b) (6)

Mr. Winston operated a company known as May Cooperage, Inc. on the leased property. A small warehouse facility with an office was located at the center of the site (Figure 2).

The site was bought by Leas-It, Inc. from the Texas Bank and Trust Company of Houston on April 28, 1982 (Reference 3). May Cooperage, Inc. operated at the site location from 1985 or 1986 to 1988 (Reference 4). Before 1985, the site was used by a mattress factory and a heavy machinery business (Reference 20). The company was moved to the Jensen Drive site from its former location at 1705 Davis Street after the Texas Water Commission (TWC) and the City of Houston filed complaints against the Davis Street site operation (Reference 1, Page 4). The site is presently for sale (Photograph 10). No other information about the history or past operations of the site was available.

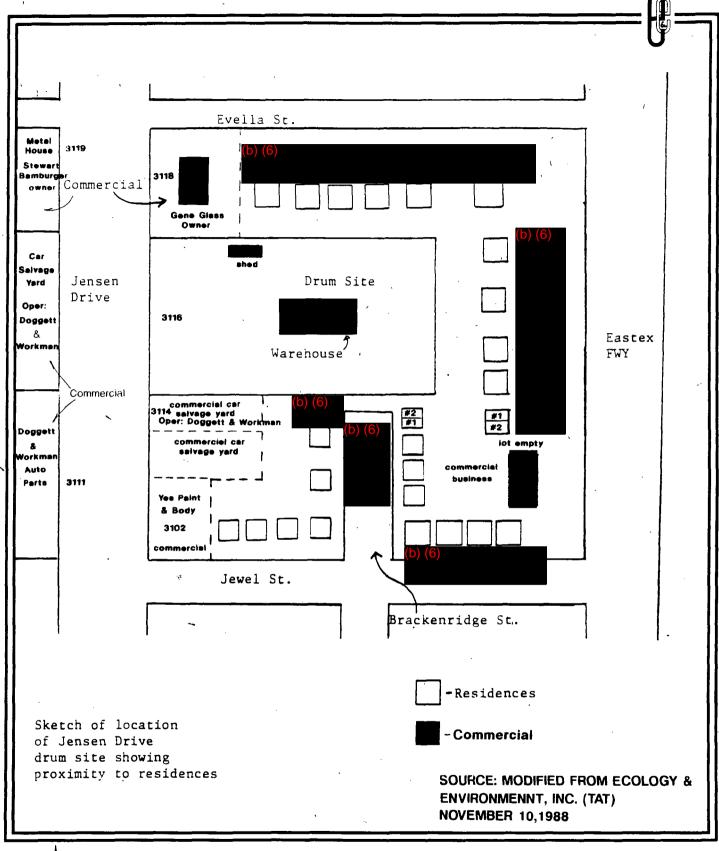

SITE OPERATIONS

May Cooperage, Inc. operated a drum reclamation business on-site. The site was inspected by the Technical Assistance Team (TAT) in August 1988 (Reference 1, Page 4). During that inspection, more than 400 drums were found on-site. Liquid wastes were found in 210 drums (Reference 4).

N 2000 ft.

The other drums were empty. It is not known if the empty drums were empty when they were brought to the site. The drums were in various stages of deterioration. Several drums with wastes were overturned and some were bulging. Incompatible wastes were placed adjacently. The site warehouse contained 91 steel drums, 20 fiberboard drums, 10 compressed gas cylinders and a 500 gallon polypropylene vat (half full). A locked office in the warehouse contained 10 five gallon cans (Reference 1, Pages 3, 49 through 53).

The site vegetation consisted of grass and weeds. Stressed vegetation was seen in various areas. Two large areas of discolored soil were observed during the TAT inspection. These areas were located to the northeast and southeast corners of the site (Reference 12, Pages 3, 4 15, 23 and 24; Figure 3). Several vehicles from a neighboring business, Doggett and Workman Auto Parts, were located on-site (Reference 1, Pages 3a and 18).

The removal of drums and contaminated soil to permitted disposal facilities was completed by the TAT on April 21, 1989 (Reference 21). All vehicles from the site were also removed (Reference 20).

WASTE HANDLING AND DISPOSAL PRACTICES

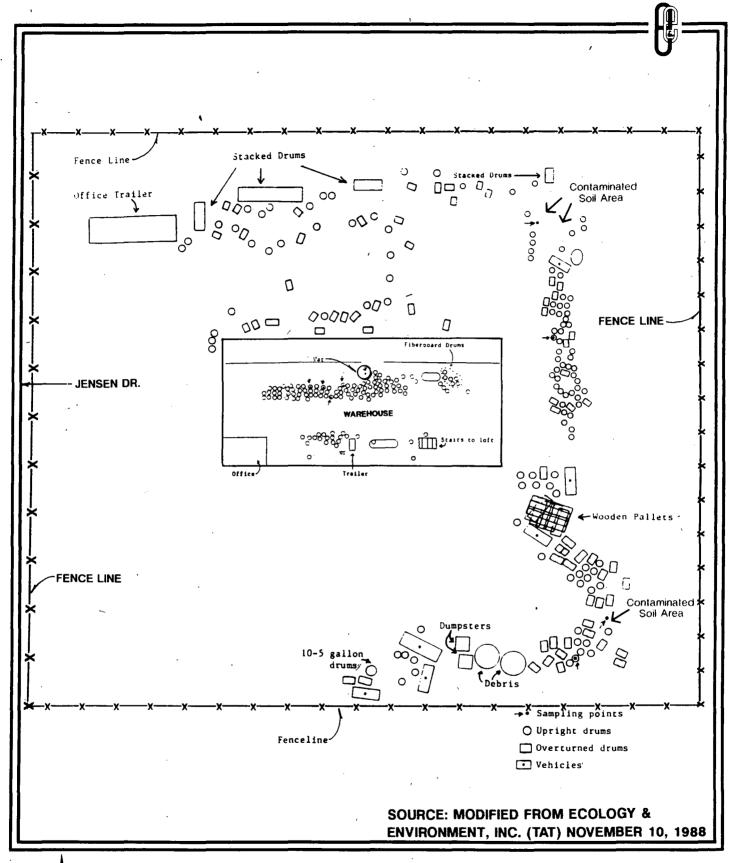

During the August 1988 TAT inspection, nine samples (six from drums, one from the plastic vat and two from the large contaminated soil areas) were collected and analyzed for metals and base/neutral/acid (BNA) organics. The analyses revealed the presence of several metals and organics: antimony, chromium, cobalt, copper, iron, lead, potassium, sodium, polynuclear aromatics, 2,4-dimethyl phenol, phthalates, benzoic acid and several unknown hydrocarbons (Reference 1, Pages 4, 7-10, 15-17 and 60-98). The site was resampled as 'part of the EPA emergency remedial action in December 1988 and from March through April 1989. The results of these analyses were similar to those of the August 1988 analysis.

The waste handling on-site was inadequate. Details of the internal site operations concerning the wastes are not known. Fourteen potentially responsible companies which originated the wastes have been identified by the EPA (Reference 21).

1.2 SUMMARY OF PRELIMINARY ASSESSMENT

The site apparently received all kinds of wastes in drums. Incompatible wastes were stored indiscriminantly, creating potential reactions and hazardous releases. Operations of the site had been abandoned at the time of the TAT inspection in August 1988. Drums were in disarray and had deteriorated. Soil in two east areas of the site were contaminated. Several abandoned and usable vehicles were noticed on-site. Release of contaminants to the atmosphere was measured by the TAT during the August, 1988 inspection.

At the time of the FIT PA, the site was undergoing an EPA emergency cleanup. The drums with wastes, after being sampled, were repacked and

N NOT TO SCALE FIGURE 3
SITE SKETCH
JENSEN DRIVE DRUM SITE
HOUSTON, TEXAS
TXD987966900

moved into the site warehouse. Removal of the drums and soil was pending the receipt of analytical results from the EPA contracted laboratories (Reference 22).

DATA COLLECTION

An on-site reconnaissance inspection was conducted by the FIT (Jairo Guevara and Jim Trusley) on September 12 and 14, 1989. There were no representatives from the site accompanying the FIT during the inspection.

The FIT interviewed Mr. Charles Lee of the Doggett and Workman Auto Parts store, located in front of the site (3111 Jensen Drive) and Mr. Stewart Bamburger of the metal house located across from the site (3119 Jensen Drive). The site is presently used by the Doggett and Workman Auto Parts to store vehicles and vehicle body parts. Mr. Bamburger is presently storing empty drums and other metal and plastic containers on the site property. The FIT also interviewed the following neighbors who operate commercial businesses or live in the same block on which the site is located:

f) (b) (6) of Metal Scrap, a business adjacent to the metal house on the north side.

The site presently stays open during the day. Personnel from Doggett and Workman possess the site gate key. Before the EPA cleanup action, the site was secured on all four sides by a five foot fence (Reference 1, Page 3). A part of the site on the northeast side had only a three foot fence which was broken and very fragile. This part has been replaced. The fence surrounding the site was increased from five to seven feet, and the three foot gate was replaced by a 10 foot gate during the cleanup operation (Reference 21).

SOURCE TYPE DESCRIPTIONS/SOURCE SIZES/SOURCE CONTAINMENT

The waste sources were the 210 drums with liquid contents stored on-site in complete disarray. Most of the drums were outdoors and some were overturned. A warehouse building contained drums, cans and a 500 gallon propylene vat approximately half full. Several cars, trucks and trailers were abandoned on-site (Reference 1, Page 3).

The EPA emergency site cleanup was completed in April 1989. All of the drums, cans and the 500 gallon vat were removed to off-site proper disposal facilities. Contaminated soil on the east part of the site was stabilized and removed to the depth of the underlying clay layer. 123 tons of contaminated soil were removed and 190 yards of fill dirt were used to level the excavated area (Reference 21).

The following table describes the three soil samples collected in the remediated area before and after excavation. Lead, reported in mg/kg, was one of the main contaminants.

	NE Area	Center Area	SE Area
Before Excavation	287	756	97.9
Sample Number	65	64	63
After Excavation	32.2 (as is basis	s) 109	253
Sample Number	67 ·	68 .	66

As indicated, the values decreased after excavation, with exception of the southeast area sample (Reference 23; Reference 24).

All of the abandoned vehicles were crushed and properly disposed or removed from the site (Reference 24). As a result, the site was completely emptied and cleaned.

The condition of the site during the FIT reconnaissance inspection is illustrated on Figure 4. Empty metal drums, empty metal dumpsters, plastic bin lids, abandoned and usable vehicles and vehicle body parts were seen on-site. High weeds were seen during the inspection in many areas of the site. Grass planted during the cleanup operation was also seen (Photographs 1 through 10).

The site sketch of neighboring houses and businesses is presented on. Figure 2.

TARGET POPULATION

Houston water supply in the northeast area is served by a combination of ground water and surface water. Five city water supply wells are located within three miles of the site (Figure 5). Domestic surface water comes from Lakes Houston (17 miles north of downtown Houston), Conroe and Livingston (Reference 13; Reference 14). The population served by the municipal water supply within four miles of the site was estimated at 237,469 (Reference 15).

The site is located in the middle of the city, with adjacent residential and industrial areas (Reference 1, Pages 3-12 and 13). Small drainage paths from the site, in the yards of houses located east-northeast and northwest of the site, were noticed during the FIT reconnaissance inspection. Healthy grass was seen in all of these yards. No environmentally sensitive areas exist within four miles of the site or within 15 miles downstream of the site (Reference 16).

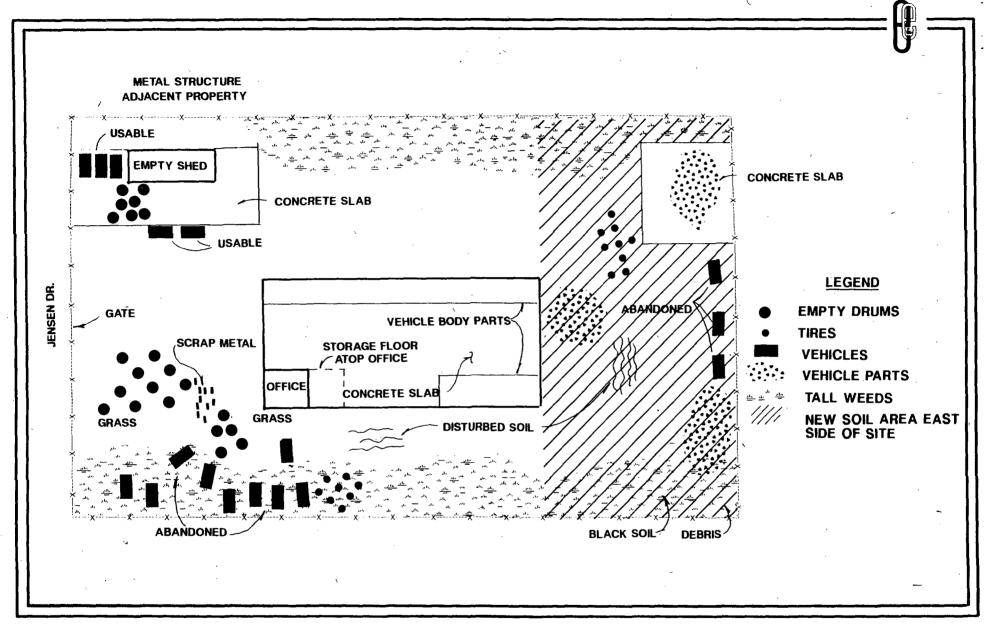

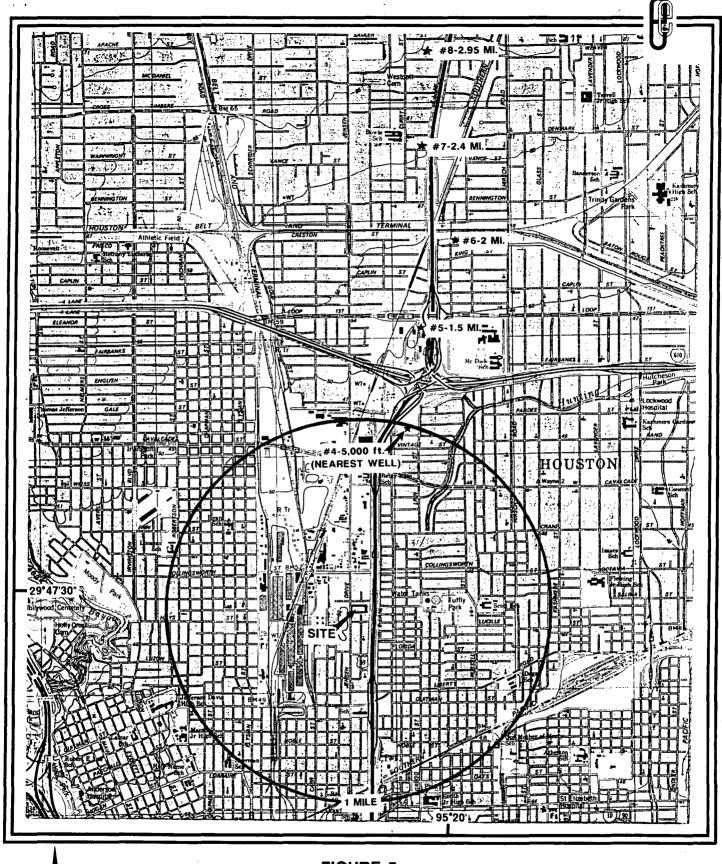

FIGURE 4
CONDITION OF SITE DURING FIT INSPECTION (9/12-14/89)

FIGURE 5
CITY OF HOUSTON NORTHEAST WELLS
JENSEN DRIVE DRUM SITE
HOUSTON, TEXAS
TXD987966900

No release of vapors was detected during the FIT reconnaissance inspection, when the site was surveyed with an HNu photoionizer.

HEALTH AND SAFETY CONCERNS

No evident health hazard existed after the EPA emergency cleanup. The empty drums, which are presently stored on-site and were noted during the reconnaissance inspection, are mainly from food companies. A few empty industrial drums were seen on-site, but they were cleaned.

CONCLUSION

Having inspected both the site and neighboring properties, the FIT does not believe that any imminent hazard to the environment or neighboring population exists. Mr. Peter Sam, EPA Superfund Site Manager, decided on September 20, 1989 against sampling of this facility (Reference 25).

Subj: Preliminary Assessment for Jensen Drive Drum Site

Houston, Harris County, TX (TXD987966900)

TDD #F06-8901-333 PAN FTX0829PAA

1. Site Information

The Jensen Drive Drum site is located at 3116 Jensen Drive Northeast, Houston, Texas 77026 (Reference 1, pages 3 and 32). The geographic coordinates are Latitude 29°47′25"N and Longitude 95°20′29"W (Reference 2 and Figure 1). The property is under the name of Leas-It, Inc., which is owned by Ronald J. Gray of Lufkin, Texas (home phone 10) (6) work phone 409/829-2282). The site is 1.465 acres, approximately 400 feet by 150 feet, and is located in a light industrial and residential area (Reference 2 and Figure 2). Apparently Mr. Gray has leased his land to Mr. Fred Winston, (b) (6)

who was operating a company on the property which is known as May Cooperage, Inc., and also named in some reports as May Cooperidge Drum Reclaiming Company. More than 400 drums were present at the site during the August, 1988 TAT sampling inspection. A small warehouse facility with an office was located at the center of the site. Several vehicles from a neighboring business, Winkman and Doggett Auto Parts (Reference 1, pages 3a and 18), were located on-site.

The site is completely surrounded by a five foot chainlink, locked fence. The side facing Jensen Drive has a gate three feet high and ten feet wide (Reference 1, page 3).

The site vegetation consists of grass and weeds. Stressed vegetation was seen in various areas. Two large areas of discolored soil were sampled by the TAT and found to be contaminated. The areas were located

Preliminary Assessment for Jensen Drive Drum Site Houston, Harris County, TX (TXD987966900)
TDD #F06-8901-33
Page 2

on the northeast corner of the site next to the fence and on the southeast corner near the fence (Reference 1, pages 3, 4, 15, 23 and 24 and Figure 3).

The FIT was tasked by the EPA to conduct a preliminary assessment on this site to determine whether any imminent environmental hazards exist off and on-site, and to define the seriousness of the problem through the multiple migration routes.

2. Background/Operating History

The site was bought by Leas-It, Inc. from the Texas Bank and Trust Company of Houston on April 28, 1982 (Reference 3). May Cooperage, Inc. has operated at the site location since 1985 or 1986 (Reference 4). The company was moved to the Jensen Drive site from its former location at 1705 Davis Street after the Texas Water Commission and the City of Houston filed complaints against the Davis Street site operation. No information about the history or past operations of the site was available.

Liquid contents were found in 210 of the more than 400 drums during the TAT inspection of August, 1988 (Reference 4). At this point, it is not known if the drums found empty at the site during this inspection were empty when they were brought there (Reference 1). The drums were numbered and their labels were recorded. The drums observed on-site during the inspection were in various stages of deterioration. Several drums were overturned and some were bulging. Incompatible wastes were placed adjacently. The pH values measured in some drums varied from 0 to 13. The site warehouse contained 91 steel drums, 20 fiberboard drums, 10 compressed gas cylinders and a 500-gallon polypropylene vat (half full). A locked office in the warehouse contained ten 5-gallon cans (Reference 1, pages 3, 49-53).

During the TAT inspection, nine samples (six from drums, one from the plastic vat and two from the large contaminated soil areas) were collected and analyzed for metals and base/neutral/acid (BNA) organics. The analyses revealed the presence of several metals and organics: antimony, chromium, cobalt, copper, iron, lead, potassium, sodium, polynuclear aromatics, 2,4-dimethyl phenol, phthalates, benzoic acid and several unknown hydrocarbons (Reference 1, pages 4, 7-10, 15-17 and 60-98). The site was recently resampled in a more comprehensive way as part of an EPA emergency remedial action. The laboratory results of these analyses have not been received (Reference 4).

3. Waste Containment/Hazardous Substance Identification

The hazardous waste constituents found on-site were listed in the previous section. Their quantities are unknown. The companies from which the wastes originated, according to the on-site drum labels, are partially included in Reference 1, pages 49-53. The total quantity of waste was estimated at 180 full drums at 75% capacity, 37.5 gallons/drum or 6,750 gallons (Reference 19).

Preliminary Assessment for Jensen Drive Drum Site Houston, Harris County, TX (TXD987966900)
TDD #F06-8901-33
Page 3

4. Pathway Characteristics

a. Air Characteristics

During the TAT inspection, HNu readings above background were observed inside the site warehouse (15 to 115 ppm) and on-site outdoors (3-5 ppm)(Reference 1, page 4). These values could be duplicated and specified to serve as an HRS documented evidence by conducting a complete air survey.

b. Ground Vater Characteristics

The important aquifers in the area are the Chicot and the Evangeline. The Chicot aquifer is approximately 1,000 feet thick and tops the Evangeline aquifer. The Chicot consists of interbedded sands, silts and clays of Pleistocene age. It is comprised of the Willis sand, the Bentley and Montgomery formations, and the Beaumont clay. The Evangeline aquifer is the most significant source of drinking water in the Houston area. It is approximately 2,000 feet thick in this area and extends from the Chicot aquifer base to the underlying Burkeville confining layer. The Evangeline is formed by the Goliad sand of Pliocene age and the Fleming formation of Miocene age. It is characterized by layers of sand and gravel with interbedded clay and silt layers (Reference 5; Reference 6).

No private wells in the area were located. Five city wells within three miles of the site are used in northeast Houston as a source of drinking water supply (Figure 4). These city wells draw water from the Evangeline aquifer and are screened at depths of approximately 600 to 625 feet. The 1969-1971 water table levels of these wells was between 332 to 367 feet (Reference 7).

A net precipitation of -6 inches per year has been estimated (Reference 8).

c. Surface Water Characteristics

The runoff from the site has two routes. One is to the northeast to Hunting Bayou (0.95 miles from the site) through the city of Houston drainage system. The second one is south to Buffalo Bayou, approximately two miles from the site. Hunting Bayou flows east and then south to discharge into the Houston Ship Channel. Buffalo Bayou flows east and becomes the Houston Ship Channel. The 15-mile downstream water bodies within the area of concern include Hunting Bayou, Buffalo Bayou and the Houston Ship Channel (Reference 2). Surface water along these 15 miles is used for limited recreation (canoeing) and industrial water supply for cooling water. These streams do not provide drinking water or irrigation supplies (Reference 9; Reference 10).

The site is located in a flat area approximately 50 feet above sea level. It does not receive drainage from other areas (Reference 2).

Preliminary Assessment for Jensen Drive Drum Site Houston, Harris County, TX (TXD987966900)
TDD #F06-8901-33
Page 4

The 2-year, 24-hour rainfall at the site area is five inches (Reference 11). The site is not located in a flood plain and the potential for flooding is minimal (Reference 12).

d. On-Site Pathway Characteristics

Spillage and migration from the site are present in different areas. Two large areas of contamination were located at the northeast and southeast corners of the site. As mentioned in the section on surface water characteristics, drainage from the site can go south to the Buffalo Bayou or northeast to the Hunting Bayou. No liners or runoff diversion systems exist at the site.

Although the site was secured and locked at the end of 1988, it was used by nearby businesses. The presence of vehicles on the site suggest that widespread contamination could exist. In addition, a stripping operation of stolen cars was carried out at the site and a person lived on-site at one time (Reference 1, page 3; Reference 19).

5. Targets

Houston water supply in the northeast area is served by a combination of ground water and surface water. As mentioned in the section on ground water, five city water supply wells are located within 3 miles of the site. Domestic surface water comes from Lakes Houston (17 miles north of downtown Houston). Conroe and Livingston (Reference 13; Reference 14). The population within four miles of the site served by the municipal water supply was estimated at 237,469 (Reference 15).

The site is located in the middle of the city with adjacent residential and industrial areas (Reference 1, pages 3-12 and 13). No environmentally sensitive areas exist within four miles of the site or within 15 miles downstream of the site (Reference 16).

6. Other Regulatory Involvement

As mentioned in the section on background/operating history, an emergency EPA remedial clean up operation is in progress at the site. Sampling by the TAT has been accomplished and the drums have been moved inside the site warehouse, pending receipt of the analytical results (Reference 4). Drums and contaminated soil will be removed from the site and disposed at appropriate facilities.

7. Conclusions and Recommendations

The site apparently received all kinds of wastes in drums. Incompatible wastes were being stored indiscriminately, creating potential reactions and hazardous releases. From the description of the August, 1988 TAT report, operations at the site had been abandoned. Drums were in disarray and had deteriorated. Two large areas of contaminated soil and stressed vegetation in several locations were observed on-site.

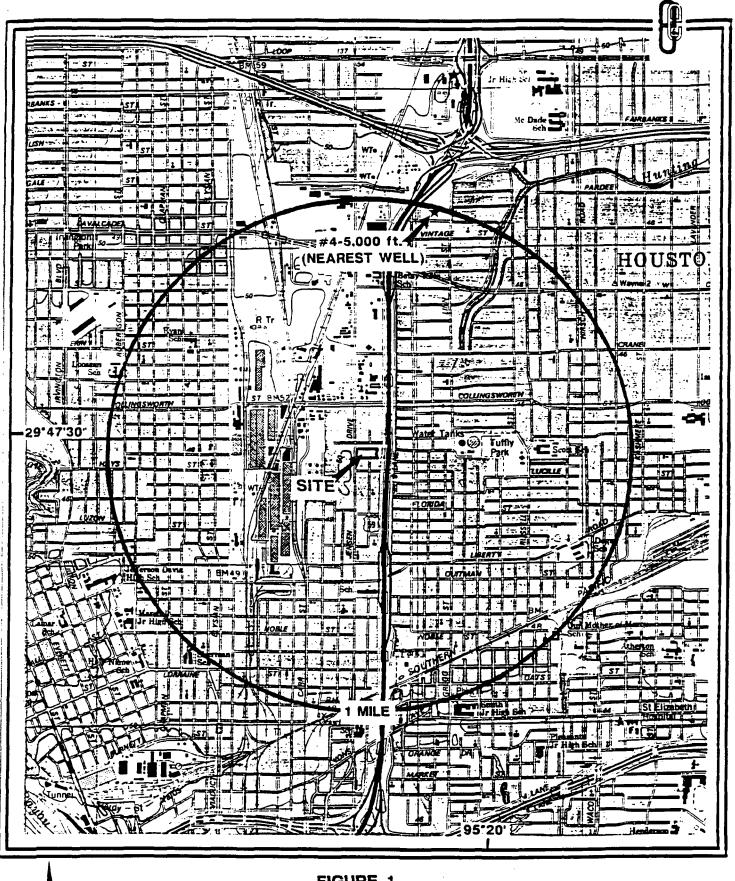

Preliminary Assessment for Jensen Orive Drum Site Houston, Harris County, TX (TXD987966900)
TDD #F06-8901-33
Page 5

During the TAT inspection, heavy metals and BNA organics were identified from drums and soil samples. Several vehicles were found on the site, including some from a neighboring auto parts business. The number of vehicles and people using the site are unknown.

A release of hazardous compounds to the atmosphere should be investigated. Quantitative readings of unidentified compounds (3 to 115 ppm) were recorded with a photoionizer instrument (HNu) by the TAT during the reconnaissance and sampling inspections in August, 1988. The readings were taken to provide general information about the site.

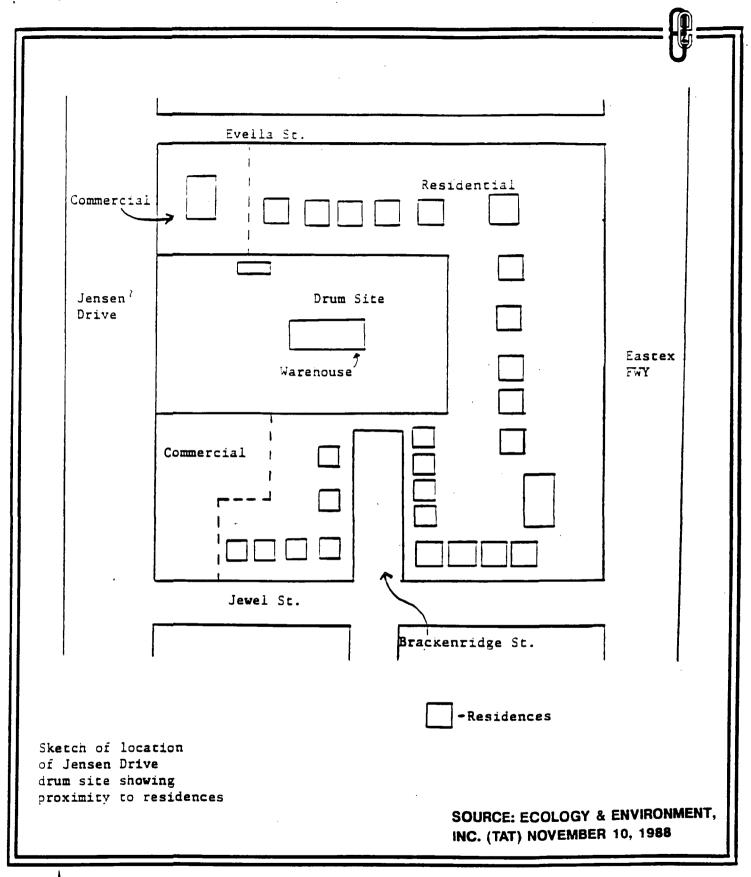

The site is presently undergoing EPA emergency remedial actions. A sample inspection by TAT has been conducted. The drums with wastes have been repacked and moved into a site warehouse. Removal of the drums and the soil is pending the receipt of analytical results from the contracted laboratories. A final report of the EPA remedial action of the site will be prepared when this operation is completed.

SUBJECT: Site Assessment of Jensen Drive Drum Site

Houston, Harris County, Texas

TDD #: T06-8810-28 PAN #: TTX 0829 SAB

Introduction

The EPA On-Scene Coordinator (OSC) and the Technical Assistance Team (TAT) performed a site assessment at the Jensen Drive drum site located in Houston, Harris County, Texas. This assessment was conducted to determine whether conditions at the site present a potential threat to public health and welfare and/or to the environment. If so, the site would be eligible for immediate removal status in accordance with the National Contingency Plan guidelines.

Current Harris County deed records indicate the property is owned by LEAS-IT, Inc. of Harris County, Texas. During a site assessment at the nearby Davis Street site, Mr. Winston informed EPA that a Mr. J. D. Gray owned the property. Mr. Gray is a representative for LEAS-IT, Inc.

Purpose

This memorandum requests approval for a Removal Action pursuant to the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) and the Superfund Amendments and Reauthorization Act (SARA) at the Jensen Street Drum site.

This action meets the criteria for initiating a removal action under Section 300.65 of the National Contingency Plan (NCP) and is anticipated to require less than twelve months and under \$2 million for completion.

- 2-

Page 2

II. Background

A. National Significance:

This site is not of national significance.

8. Site Description:

The Jensen Drive drum site is located at 3116 Jensen Drive, two blocks south of Collingsworth in northeast Houston. It is in a light industry and residential area. Inhabited houses are as close to the site as 30 feet. Three churches are located near the site, and a school is less than one-half mile away.

The site itself occupies a rectangular lot measuring approximately 400 feet by 150 feet. There is a warehouse in the center of the site with two open bay doors facing east and west. The site is surrounded by a five foot chain link fence. The side facing Jensen Drive is secured only by a gate three feet high and ten feet wide. The gate is chained and pad locked. A key is kept across the street at Winkman and Doggett Auto Parts.

There are a number of vehicles on the site. These vehicles include cars, trucks and trailers. Charles Lee of Workman and Doggett Auto Parts informed TAT that some of the vehicles belong to the Auto Parts store. Mr. Lee also told TAT that a car stripping operation was going on at the site until the Houston Police shut it down.

Over 400 drums of unknown content are present on site. Many of the drums are empty and/or overturned. The drums were checked for liquid contents. Those that had any contents were numbered consecutively with spray paint. The drums are in varying stages of deterioration and some are bulging. Measurements taken of the drum contents indicated material present with pH ranging from 0-13. For example, drum #81, labeled sulfuric acid, had a pH of 0. Drum #82, immediately adjacent to #81 had a pH of 13. Many of the drums bore labels. Information compiled from the labels is presented in Table 4 included in the attachment.

Vegetation on site consists of weeds and grass. The perimeter of the site is overgrown. Various areas show stress vegetation. There are areas of chemical stained soil evident throughout the site. Two large areas of soil discoloration where present. One is on the northeast corner of the site at the fence line. The other, at the southeast corner of the site, is also adjacent to the fence line. The land in the area is generally flat. Buffalo Bayou is less than one mile south of the site (see topographic map attachment).

The warehouse contains 91 steel drums, 20 filterboard barrels, 10 compressed gas cylinders and a 500 gallon polypropylene vat that is about half full. There is a small locked office in the southwest corner of the warehouse. This office has 10 five gallon cans. There is a loft along the interior south side of the warehouse where lumber is stored.

TDD#: T06-8810-28

Page 3

Ambient air monitoring was conducted with an explosimeter, the RAM 10, and the HNU photoionization detector. No explosive or oxygen deficient atmospheres were observed. No radiation above background was present. HNU readings above background where observed in various locations throughout the site. Outside of the warehouse several readings in the range of 3-5 (isobutylene equivalency) ppm were measured. Inside the warehouse, three separate readings of 15 ppm, 50 ppm and 110 ppm were measured.

C. Incident Characteristics

Historical accounts on this site are limited. However, the site was known to be the location of the May-Cooperidge Drum Reclamation Co. owned by Fred Winston. A complaint by an anonymous caller prompted the Texas Water commission (TWC) and the City of Houston to file complaints against Mr. Winston. Mr. Winston moved his operation to 3116 Jensen Drive from 1705 Davis Street, another site which is currently under EPA evaluation.

D. Quantity and Types of Substances Present

On 30 August 1988, Technical Assistance Team personnel collected and transported a vat sample, six drum and two soil samples to the EPA Houston laboratory for BNA and metals analysis. The approximate location of each sample is shown on the attached site sketch.

The results of analysis are summarized in the following tables. The laboratory report is included in the attachments. Inorganic analysis results for arum samples are shown in Table 1, also included is the EPA drinking water standards if applicable. Table 2 summarizes the inorganic results for the two soil samples. Table 3 is a summary of the organic analysis for both drum and soil samples. It included the concentrations and the toxicity properties of each compound of interest.

There are a number of inorganic compounds on site which can be considered toxic. Notably the levels of iron, lead and manganese are elevated. Those organic compounds listed as hazardous substances in 40 CFR 302.4 were considered of interest and reported with the pertinent toxicological information. The list is lengthy and includes a number of carcinogens.

E. State and Local Authorities Role:

F. Federal Action To Date:

On 30 August 1968, the EPA Emergency Response Branch conducted a site assessment at this site to evaluate the potential threat to the public health on the environment which exists at the site.

G. NPL Status

This site is not on the National Priorities List.

TDD#: TUb-001U-20

Page 4

III. THREAT TO PUBLIC HEALTH, WELFARE OR THE ENVIRONMENT

A. Three obvious threats to public health are present at the Jensen Street Site:

- l). High concentrations of metals metals can be highly toxic if ingested or inhaled. Metals may be transported offsite via airborne or surface migration and affect the surrounding properties.
- 2). Numerous toxic organic compounds there are a large number of organic compounds that are hazardous substances. These compounds may be transported off site via airborne or surface migration and affect the surrounding properties. Headspace monitoring indicates the presence of volatile organic compounds which could potentially be toxic, explosive, flammable and/or carcinogenic. Of the compounds listed many when heated decompose and emit toxic fumes. A fire at the site could potentially cause an airborne disaster.
- 3). Numerous drums on-site these drums are in varying stages of deterioration and many are leaking unknown compounds. The metals and hazardous organic compounds present a direct contact, inhalation and ingestion threat because of the deteriorating nature of the drums.

B. Threats to the Environment:

A release of these materials would contaminate the surrounding soil, water, and drainage area. An air release, possibly from a fire, would result in a much greater extent of contamination of the surrounding air, soil, water and vegetation.

IV. Enforcement

V. Proposed Actions and Costs

VI. Expected Change In the Situation Should No Action Be Taken

Without further attention, the containers will continue to deteriorate. If this is allowed, the health and welfare of the area residents will be endangered. If the materials are inadvertently allowed to mix with one another, a fire and explosion danger to the local citizens may result. In the event of a fire toxic fumes would be emitted, endangering the local citizens in the area.

If a removal is not conducted soon, it is likely that a removal would have to be conducted under emergency conditions. The more time these containers are allowed to deteriorate, the greater the probability for the liberation and release of cnemical substances to the atmosphere with detrimental health effects.

TDD#: TU6-8010-28

Page o

VII. Important Policy Issues

Not applicable

VIII. Recommendation

Because conditions at the site meet the NCP section 300.65 (b) (2) criteria for a removal, I recommend your approval of the proposed removal action. The estimated total project costs are of which are for extramural cleanup contractor costs. You may indicate your approval or disapproval by signing below.

SUBJECT: Notice of Intent to Dispose of Samples

FROM: Diana Ayers, Chief, Houston Branch; 6E-H

TO: Charles Gazda, Chief, Emergency Response Branch; 6E-E

The Houston Laboratory is required to dispose of all hazardous wastes we generate in a manner consistent with RCRA regulations. This includes all samples received for analysis provided we find them to contain contaminants which classify them as RCRA hazardous wastes.

I have included this memorandum in the final analytical report to serve as notice to the program that we have completed all analysis. If we have any of the original sample remaining after analysis is complete we will dispose of it within 90 days. Please note that even though original sample may be left over, it does not mean that a reanalysis of the sample may be requested since the sample has most likely exceeded its holding time and any subsequent analysis may not be valid.

If you have a need to hold these samples in custody longer than 90 days, please sign below and return this memorandum to me within the next 30 days. Also, state briefly your need to hold these samples in custody.

Thank you for your cooperation in this request.

#### **MEMORANDUM**

DATE:

October 17, 1988

SUBJECT:

Laboratory Results for Jensen St. Drums (3TFAKC46)

FROM:

Diana Ayers, Chief, Houston Branch; 6E-H Daw & Tayol for

TO:

Charles Gazda, Chief, Emergency Response Branch; 6E-E

ATT:

Pat Hamick: 6E-EF

Attached are the analytical results for the subject site. Ten samples were received on September 1, 1988 for analysis of ABN and metals(HSL).

This is a final report.

MEMORANDUM

SUBJECT:

Laboratory results for Jensen Street Drum. A. Lay Classe M. Kendall Young

FROM: for

Chief

Inorganic Section

TO:

Diana G. Ayers

Chief

Houston Branch

Attached are laboratory results for the subject site. Ten (10) samples were received on September 2, 1988 to analyzed for metals.

The laboratory numbers assigned were 8TFAKC4601 through 8TFAKC4610.

This is a final report.

February 1975

Second Printing August 1975

## ANALOG-MODEL STUDIES OF GROUND-WATER HYDROLOGY IN THE HOUSTON DISTRICT, TEXAS

#### INTRODUCTION

#### Purpose and Scope of the Project

Continual declines of water levels in wells, land-surface subsidence, and salt-water encroachment are problems related to ground-water pumping in the Houston district that necessitate additional studies of the hydrologic system.

This study was begun in 1970 by the U.S. Geological Survey in cooperation with the city of Houston and the Texas Water Development Board. The principal purpose was to develop a means for forecasting declines in the altitudes of the potentiometric surfaces (levels to which water will rise in tightly cased wells) under various conditions of pumping. Because of the complexity of the hydrologic system, an electric analog model was chosen as the most suitable device for analyzing the system and simulating future responses.

This report presents the results of the geologic and hydrologic studies, discusses the theory and construction of the analog model, and presents the simulation of the declines in the altitudes of the potentiometric surfaces as determined by using the model.

Most of the data upon which this report is based are available in reports by the U.S. Geological Survey and the Texas Water Development Board (see references) or in the files of the U.S. Geological Survey in Houston. Data are obtained through a continuing cooperative program of the U.S. Geological Survey, the Texas Water Development Board, the city of Houston, and the city of Galveston.

For those readers interested in using the metric system, metric equivalents of English units of measurements are given in parentheses. The English units used in this report may be converted to metric units by the following conversion factors:

Fro	m	Mutiply	To obtain			
Unit	Abbre- viation	ρA	Unit	Abbre- viation

square mile	mi²	2.590	square kilometer	km²	

## Description of the Area

The Houston district, as used in this report, consists of all of Harris, Waller, and Fort Bend Counties and parts of Galveston, Montgomery, Brazoria, Chambers, and Liberty Counties (Figure 1). The area of the district is approximately 6,600 square miles (17,100 square kilometers).

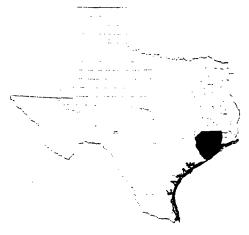

Figure 1.-Location and Extent of the Houston District

Except for a small area in Montgomery and Waller Counties, the land surface is nearly flat and featureless:

the only significant relief is in the valleys of the streams. The land is generally treeless in the rural areas from Houston southeast to Galveston.

The climate of the Houston district is characterized by mild winters and hot symmers. The lowest temperature recorded at Houston was 15°F (-9.5°C) and the maximum temperature was 108°F (42°C). The mean annual temperature is 69.2°F (20.6°C). The 30-year average (1931-60) rainfall at Houston was 45.95 inches (116.7 centimeters); monthly rainfall is distributed uniformly throughout the year.

The Houston district has a large and diversified industrial economy, but also has extensive agricultural developments. Large amounts of water are used by industry for processing and cooling purposes and by rice and cotton growers for irrigation. The rapid growth and development of the district are due in part to the availability of large amounts of inexpensive ground-water supplies. The locations of the major pumping areas are shown on Figure 2.

#### **Previous Studies**

Among the more comprehensive earlier reports describing the geology and hydrology of the Houston district is the report by Lang and others (1950). Pettit and Winslow (1957) summarized the geology and ground-water resources of Galveston County. The relation of salt water to fresh ground water in Harris County was discussed by Winslow and others (1957). Land-surface subsidence and its relation to the withdrawal of ground water in the Houston-Galveston area was first reported by Winslow and Doyel (1954) and later by Gabrysch (1969).

Previous ground-water investigations were made in Waller County (Wilson, 1967); Liberty County (Anders and others, 1968); Montgomery County (Popkin, 1971); Fort Bend County (Wesselman, 1972); Brazoria County (Sandeen and Wesselman, 1973); and Chambers County (Wesselman, 1971). These studies provided relatively recent data on the ground-water resources and ground-water development in most of the Houston district exclusive of Harris and Galveston Counties.

A report containing data on ground-water withdrawals and water-level declines in Galveston and Harris Counties was prepared by Gabrysch (1972), and the role of groundwater in the development of the water system for the city of Houston was described in reports by Turner, Collie and 8raden, Inc. (1966, 1972).

A report by Wood and Gabrysch (1965) describes the results of the first analog-model study of ground-water hydrology in the Houston district. The usefulness of the first analog model was limited because the simulations required that the aquifers be operated independently of each other and because the results of pumping in the western part of the area could not be simulated. Evaluation of the performance of the first model indicated that improvement in aquifer designation was needed and that the transmissivity of the aquifers and vertical leakage between the aquifers were not adequately modeled.

#### Acknowledgments

The author expresses his appreciation to Mr. D. E. VanBuskirk of the city of Houston Water Department and to the well owners and drillers who supplied pertinent information for this study. The aquifers in the district were mapped by John Wesselman, U.S. Geological Survey, and the model was designed and constructed by William Bruns, U.S. Geological Survey.

#### **GEOHYDROLOGY**

The geologic formations from which most of the ground water is pumped in the Houston district are composed of sedimentary deposits of gravel, sand, silt, and clay. The formations, from oldest to youngest, that form important hydrologic units are: The Catahoula Sandstone and Fleming Formation of Miocene age; the Goliad Sand of Pliocene age; the Willis Sand, Bentley and Montgomery Formations, and Beaumont Clay of Pleistocene age; and alluvium of Quaternary age (Table 1). Correlation of the hydrologic units from northern Montgomery County to the Gulf of Mexico is shown by the chart on Figure 3.

With exception of the alluvium and the Goliad Sand, the formations crop out in belts that are nearly parallel to the shoreline of the Gulf of Mexico. The younger formations crop out nearer the Gulf and the older ones farther inland. All the formations thicken downdip so that the older formations dip more steeply than the younger ones. Locally, however, the occurrence of salt domes and faults may cause reversals of the regional dip and thickening or thinning of individual beds.

Salt domes are cylindrical structures resulting from the upward movement of salt masses that are probably of Mesozoic age. In some areas, the salt domes penetrate the uppermost aquifer and nearly reach the surface. In

most instances, however, the domes pierce only the lower aquifers. Ground-water circulation within the vicinity of the domes may result in salt water contamination.

Faults in the area may have several hundred feet of displacement in the older Tertiary formations, but displacement tends to decrease upward so that the faulting may not be apparent at the surface; generally, the geologic units containing fresh water are not displaced enough to disrupt hydraulic continuity.

#### Description of the Water-Bearing Units

#### Chicot Aquifer

The Chicot aquifer is composed of the Willis Sand, Bentley Formation, Montgomery Formation, Beaumont Clay, and Quaternary alluvium (Table 1). The Chicot includes all deposits from the land surface to the top of the Evangeline aquifer (Figure 4).

The basis for separating the Chicot aquifer from the underlying Evangeline aquifer is primarily a difference in hydraulic conductivity, which in part causes the difference in the altitudes of the potentiometric surfaces in the two aquifers.

In most of the Houston district, the Chicot aquifer consists of discontinuous layers of sand and clay of about equal total thickness, and in some parts of the district, the aquifer can be separated into an upper and lower unit. Throughout most of Galveston County and southeast Harris County, the basal part of the lower Chicot aquifer is formed by a massive sand section with high hydraulic conductivity. (See Figure 4.) This sand unit, which is heavily pumped, is known locally as the Alta Loma Sand. In many previous reports, the unit is identified as the Alta Loma Sand of Rose (1943). The term Alta Loma Sand is not often used in this report because the stratigraphic relationships are not clear.

If the upper unit of the Chicot aquifer cannot be defined in a particular area, the aquifer is said to be undifferentiated. The areal extent of the upper unit roughly corresponds to the areal extent of the Beaumont Clay. The areas in which the aquifer cannot be differentiated into units are mostly in the northern part of the district (Figure 5).

Wells that are completed in the uppermost sand layers of the Chicot aquifer and that have water levels that are distinctly higher than water levels in wells

completed in the underlying sand layers are considered to produce water from the upper unit.

The transmissivity of the Chicot aquifer ranges from zero to about 20,000 ft²/day (feet squared per day) or 1,858 m²/day (meters squared per day). The storage coefficient ranges from 0,0004 to 0,20 (Figure 6). The larger values of the storage coefficient occurs in the northern part of the district where the aquifer is partly or totally unger water-table conditions.

#### Evangeline Aquifer

The Evangeline aquifer, which is the most important source of fresh ground water in the Houston metropolitan area, consists of layers of sand and clay that are present throughout the district except where the unit is pierced by salt domes (Figure 7). The aquifer is underlain by the Burkeville confining layer.

The transmissivity of the Evangeline aquifer ranges from less than 5,000 ft²/day (460 m²/day) to about 15,000 ft²/day (1,400 m²/day). (See Figure 8.) In general, the horizontal hydraulic conductivity of the Evangeline aquifer is less than the horizontal hydraulic conductivity of the Chicot aquifer, but because the Evangeline is generally thicker than the Chicot, it is generally more transmissive.

The storage coefficient of the Evangeline ranges from about 0.0005 to 0.0002 where it occurs under artesian conditions; in the outcrop area, where the aquifer is under water-table conditions, the storage coefficient ranges from greater than 0.002 to 0.20.

#### **Burkeville Confining Layer**

The Burkeville confining layer, which in the outcrop area is in the upper part of the Fleming Formation of Tertiary age, is composed mostly of clay but contains some layers of sand. The Burkeville restricts the flow of water except where it is pierced by salt domes and in the northeastern part of the district where it contains many water-yielding sand layers. The Burkeville is underlain by the Jasper aquifer.

## Declines in the Altitudes of the

Records of ground-water withdrawals in the Houston district date back to 1887, and records exist for probably 90 percent of the total withdrawals. Use of ground water increased slowly until about 7, when rapid industrialization increased the rate of in 1955, surface water from the San Jacinto River ke Houston) became available, and the use of ground ster remained relatively constant until 1962. From 1962 to 1970, the use of ground water increased to bout 575 mgd (million gallons per day) or 2.2 million material for 1890-1970 and the oredicted withdrawais for 1971-80 are snown on Figure 9.

The pumping of large quantities of ground water has caused large declines in the altitudes of the potentiometric surfaces in the aquifers, except in the upper unit of the Chicot. The declines from 1890 to 1953, from 1890 to 1960, and from 1890 to 1970 in the lower unit of the Chicot aquifer and in the Chicot aquifer undifferentiated are shown on Figures 10, 11, and 12. Figures 13, 14, and 15 show the decline of the altitude of the potentiometric surface in the Evangeline aquifer for the same periods.

By 1970, the altitude of the potentiometric surface had declined a maximum of about 330 feet (100 meters) in the lower unit of the Chicot aquifer and Chicot aquifer undifferentiated and about 430 feet (130 meters) in the Evangeline aquifer.

Not enough data are available to map the decline of the altitude of the potentiometric surface in the upper unit of the Chicot aquifer.

#### Houston Area

Nearly all the ground water pumped in the Houston area (Figure 2) is from wells screened in the Evangeline or Chicot aquifers, and many of the wells are screened in both aquifers. (The reader should note that the Houston area is only a part of the Houston district.) The declines of water levels in wells screened in each of the aquifers are shown on Figure 16. Locations of the wells are shown on Figure 2.

Declines in the Evangeline aquifer and the lower unit of the Chicot aquifer have been the greatest. The upper unit of the Chicot is relatively undeveloped; therefore, the decline of water levels shown on Figure 16' for the upper unit of the Chicot is due in part to the discharge of water to the lower unit.

#### Pasadena Area

The Pasadena area is an industrialized area east of the Houston area and mostly west of the San Jacinto

River (Figure 2). Most of the ground water pumped in this area is from the Evangeline aquifer, but a considerable amount is withdrawn from the lower unit of the Chicot in the southeastern part of the area. A small and mostly unrecorded amount is pumped from the upper unit of the Chicot.

Figure 17 shows the decline of water levels in three wells, each of which is screened in a different water-bearing unit. The decline of the altitude of the potentiometric surface in the upper unit of the Chicot is not as great as the decline in either the Evangeline or the lower unit of the Chicot. The decline in the upper unit of the Chicot is attributed to discharge to the lower unit and to a small amount of pumping.

### Katy Area

The Katy area is an agricultural area west of the Houston area and includes the northern and western parts of Harris County, about half of Waller County, and northern Fort Bend County (Figure 2).

Ground water is used exclusively in the Katy area and most of it is used for rice irrigation. Most of the water pumped is from the lower unit of the Chicot aquifer, the Chicot aquifer undifferentiated, and the Evangeline aquifer. In the northern part of Fort Bend County, along the Brazos River, some water is pumped from the alluvium, which is a part of the upper unit of the Chicot aquifer.

Figure 18 shows the water-level declines in well LJ-65-04-507, completed in the Chicot aquifer undifferentiated and in well LJ-65-04-607, completed in the Evangeline aquifer. Declines are greater in wells screened in the Evangeline aquifer than in wells screened in the Chicot aquifer undifferentiated.

#### Baytown-LaPorte Area

The Baytown-LaPorte area extends eastward from the Pasadena area to the Chambers County line (Figure 2). It is primarily an industrial area, in which most of the ground water used is pumped from the lower unit of the Chicot aquifer.

Figure 19 shows the water-level declines in well LJ-65-24-606, screened in the Evangeline aquifer and in well LJ-65-24-501, screened in the lower unit of the Chicot aquifer. Although most withdrawals in the area are from the lower unit of the Chicot, the rate of decline in the Evangeline is nearly as large as the decline in the lower unit of the Chicot.

a result of pumping. The northern part of the district also has the highest vertical leakage, which allows water to move easily from the surface to the Chicot aquifer.

### Limitations on Use of the Analog Model

The values of the parameters modeled are rational values for the hydrologic system. Further investigation and new data will allow refinements to be made and will allow more accurate determination of the values for the parameters modeled.

The model was not designed to simulate the effects of one well over a short period of time. The model was designed to simulate the effects of withdrawal of water from a well field for periods of a year or longer.

The model was not designed to predict subsidence accurately; although, the simulation of clay compaction was included. Declines in the altitudes of the potentiometric surfaces are simulated, and these values can be used in calculations to predict subsidence.

Caution should be used in applying the modeled values in equations to predict short-term specific capacity of an individual well. The model simulates leaky-aquifer conditions with clay storage for time intervals greater than 1 year.

## Data Required for Improvement of the Model

Observation wells that are screened in only one water-bearing unit are needed for better calibration of the model. The areas where measurements from such observation wells are needed are determined easily by noting the areas in which no potentiometric measurements are shown on Figures 12 and 15.

The accuracy of the model could be improved by better delineation of the water-bearing sands above the basal sand (Alta Loma Sand of Rose, 1943) of the lower unit of the Chicot in the Texas City area. To improve the correlation of observed and measured declines in the altitude of the potentiometric surface in the Texas City area, it was necessary to program extra pumpage.

More data are needed on the quantity of ground water pumped for irrigation in the vicinity of Dayton and Liberty and on the quantity of water discharged from flowing and pumped wells prior to 1930 in Galveston County.

The model could be modified to simulate clay compaction more accurately if the storage coefficient for clay compaction is determined accurately for each aquifer. In the present model, the storage coefficient for clay compaction is modeled as existing entirely between the land surface and the centerline of the lower unit of the Chicot aquifer and the Chicot aquifer undifferentiated. To distribute the storage coefficient accurately, more data concerning the characteristics of these clay layers are needed. These data can be obtained from consolidation tests on core samples, records of clay compaction from compaction recorders, and possibly from studies of various types of geophysical logs.

The present model could be modified to be one of the elements of a hybrid analog-digital model that could be used for detailed studies of such problems as salt-water encroachment'and land-surface subsidence.

#### SUMMARY

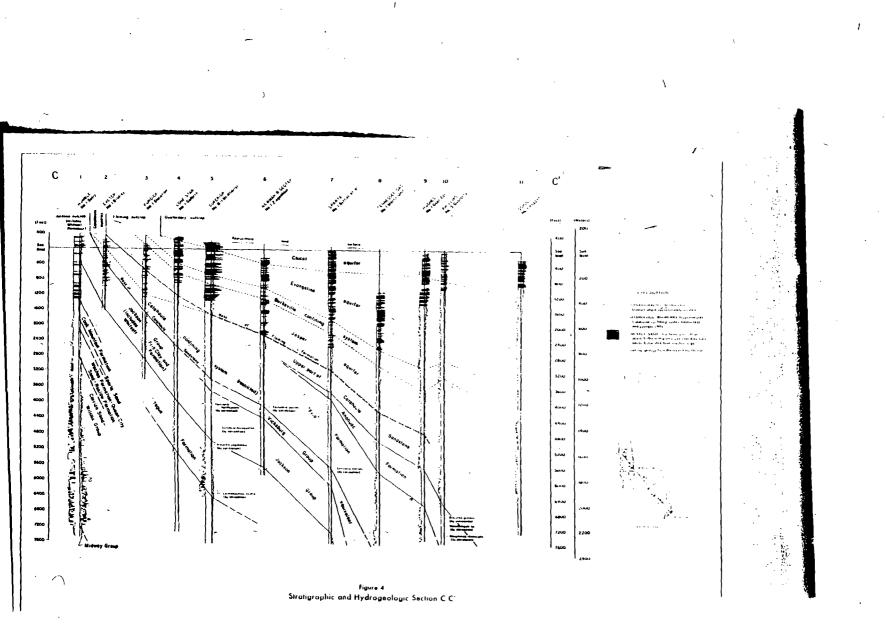

The Houston district has two major aquifers above the Burkeville confining layer. The uppermost aquifer is the Chicot aquifer, which consists of sand and clay layers that dip gently toward the Gulf of Mexico. In places in the Houston district, the Chicot aquifer can be separated into an upper and a lower unit.

The upper unit, which is not an important source of water for most of the district, can be defined where the altitude of the potentiometric surface differs from the altitude of the potentiometric surface in the lower unit. Where the upper unit cannot be defined, the aguifer is said to be undifferentiated.

The Evangeline aquifer, which is the major aquifer in the district, underlies the Chicot aquifer and consists of sand and clay layers that dip toward the Gulf of Mexico.

The Burkeville confining layer consists mostly of clay layers that form an effective barrier to ground-water flow at nearly all locations except at and near the outcrop of the Evangeline aquifer in Montgomery County.

The large cones of depression in the potentiometric surfaces in the lower unit of the Chicot aquifer, the Chicot aquifer undifferentiated, and the Evangeline aquifer are caused by large withdrawals of water. Water now flows toward the center of these cones, creating a reversal of the original hydraulic gradient in most areas south of Houston. This reversal of the hydraulic gradient has resulted in salt-water encroachment toward the centers of the cones, but

This report was prepared by the U.S. Geological Survey under cooperative agreement with the Texas Department of Water Resources.

# STRATIGRAPHIC AND HYDROGEOLOGIC FRAMEWORK OF PART OF THE COASTAL PLAIN OF TEXAS

#### INTRODUCTION

This report has been prepared to illustrate the stratigraphic and hydrogeologic framework of a part of the Coastal Plain of Texas from the Sabine River to the Rio Grande. It is the outgrowth of a project that has as its ultimate objective the construction of a digital ground-water flow model, if feasible or desirable, of at least a part of the Miocene aquifers in the Gulf Coastal Plain of Texas. The model would serve as a tool for planning the development of the ground-water supplies. Work on the project is being done by the U.S. Geological Survey in cooperation with the Texas Department of Water Resources.

During the course of delineating the Miocene aquifers, which is basic to the design and development of the model, the scope of the study was broadened to include delineations of other hydrogeologic units, as well as delineations of stratigraphic units. As a result, units ranging in age from Paleocene to Holocene were delineated (Table 1). A relationship of stratigraphic units to designated hydrogeologic units was thus established statewide.

Eleven dip sections and 1 strike section are included in this report. The dip sections are spaced about 50 miles (80 km) apart with the most easterly one being near the Sabine River and the most southerly one being near the Rio Grande. Each dip section is about 100 miles (161 km) long and extends from near the coastline to short distances inland from the outcrop of the oldest Miocene formation-the Catahoula Tuff or Sandstone. The strike section, which is about 500 miles (804 km) long (in three segments), extends from the Sabine River to the Rio Grande and joins the dip sections at common control points. This section is from 50-75 miles (80-121 km) inland from the Gulf of Mexico and is essentially parallel to the coastline. The location of the sections and the Catahoula outcrop are shown on Figure 1.

The sections extend from outcrops at the land surface to maximum depths of 7,600 feet (2,316 m)

below sea level. Selected faunal occurrences, where known or inferred by correlation from nearby well logs, are included. The extent of sand that contains water having less than 3,000 mg/l (milligrams per liter) of dissolved solids was estimated from the electrical characteristics shown by the logs. This information is included on all of the sections.

Although faulting is common in the Coastal Plain and is complex in some areas, all faults have been omitted from the sections to maintain continuity of the stratigraphic and hydrogeologic boundaries. The disadvantage of such omission is, of course, the representation of an unrealistic and simplistic picture of unbroken strata with uninterrupted boundaries. In reality, many of the faults have not only broken the hydraulic continuity of the strata but more importantly have become barriers to fluid flow or conduits for cross-formational flow. The sections are presented in this report as Figures 2-15.

subsurface correlations of the Catahoula-Fleming contact, as well as formation thicknesses, will continue to differ

#### **Burkeville Confining System**

The Burkeville confining system, which was named by Wesselman (1967) for outcrops near the town of Burkeville in Newton County, Texas, is delineated on the sections from the Sabine River to near the Rio Grande. It separates the Jasper and Evangeline aquifers and serves to retard the interchange of water between the two aquifers.

The Burkeville has been mapped in this report as a rock-stratigraphic unit consisting predominantly of silt and clay. Boundaries were determined independently from time concepts although in some places the unit appears to possess approximately isochronous boundaries. In most places, however, this is not the case. For example, the entire thickness of sediment in the Burkeville confining system in some areas is younger than the entire thickness of sediment in the Burkeville in other places.

The configuration of the unit is highly irregular. Boundaries are not restricted to a single stratigraphic unit but transgress the Fleming-Oakville contact in many places. This is shown on sections D-D' to G-G' and J-J' (Figures 5-8 and 11). Where the Oakville Sandstone is present, the Burkeville crops out in the Fleming but dips gradually into the Oakville because of facies changes from sand to clay downdip.

The typical thickness of the Burkeville ranges from about 300 to 500 feet (91 to 152 m). However, thick sections of predominantly clay in Jackson and Calhoun Counties account for the Burkeville's gradual increase to its maximum thickness of more than 2,000 feet (610 m) as shown on section F-F' (Figure 7).

The Burkeville confining system should not be construed as a rock unit that is composed entirely of silt and clay. This is not typical of the unit, although examples of a predominance of silt and clay can be seen in some logs in sections H-H' and I-l' (Figures 9-10). In most places, the Burkeville is composed of many individual sand layers, which contain fresh to slightly saline water; but because of its relatively large percentage of silt and clay when compared to the underlying Jasper aquifer and overlying Evangeline, the Burkeville functions as a confining unit.

#### Evangeline Aquifer

The Evangeline aquifer, which was named and defined by Jones (Jones, Turcan, and Skibitzke, 1954) for a ground-water reservoir in southwestern Louisiana, has been mapped also in Texas, but heretofore has been delineated no farther west than Washington, Austin, Fort Bend, and Brazoria Counties. Its presence as an aquifer and its hydrologic boundaries to the west have been a matter of speculation. D. G. Jorgensen, W. R. Meyer, and W. H. Sandeen of the U.S. Geological Survey (written commun., March 1, 1976) recently refined the delineation of the aquifer in previously mapped areas and continued its delineation to the Rio Grande. The boundaries of the Evangeline as they appear on the sections in this report are their determinations.

The Evangeline aquifer has been delineated in this report essentially as a rock-stratigraphic unit. Although the aquifer is composed of at least the Goliad Sand, the lower boundary transgresses time lines to include sections of sand in the Fleming Formation. The base of the Goliad Sand at the outcrop coincides with the base of the Evangeline only in South Texas as shown in sections H-H' to K-K' (Figures 9-12). Elsewhere, the Evangeline at the surface includes about half of the Fleming outcrop. The upper boundary of the Evangeline probably follows closely the top of the Goliad Sand where present, although this relationship is somewhat speculative.

The Evangeline aquifer is typically wedge shaped and has a high sand-clay ratio. Individual sand beds are characteristically tens of feet thick. Near the outcrop, the aquifer ranges in thickness from 400 to 1,000 feet (122 to 305 m), but near the coastline, where the top of the aquifer is about 1,000 feet (305 m) deep, its thickness averages about 2,000 feet (610 m). The Evangeline is noted for its abundance of good quality ground water and is considered one of the most prolific aquifers in the Texas Coastal Plain. Fresh to slightly saline water in the aquifer, however, is shown to extend to the coastline only in section J-J' (Figure 11).

#### Chicot Aquifer

The Chicot aquifer, which was named and defined by Jones (Jones, Turcan, and Skibitzke, 1954) for a ground-water reservoir in southwestern Louisiana, is the youngest aquifer in the Coastal Plain of Texas. Over the years, the aquifer gradually was mapped westward from Louisiana into Texas where, heretofore, its most

westerly mapped limit was Austin, Fort Bend, and Brazoria Counties. In this report, the delineation of the Chicot was refined in previously mapped areas and extended to near the Rio Grande by D. G. Jorgensen, W. R. Meyer, and W. M. Sandeen of the U.S. Geological Survey (written commun., March 1, 1976).

It is believed that the base of the Chicot in some areas has been delineated on the sections in this report as the base of the Pleistocene. Early work in Southeast Texas indicates that the Chicot probably comprises the Willis Sand, Bentley Formation, Montgomery Formation, and Beaumont Clay of Pleistocene age and any overlying Holocene alluvium (Table 1). The problem that arises in this regard is that the base of the Pleistocene is difficult to pick from electrical logs. Thus any delineation of the base of the Chicot in the subsurface as the base of the Pleistocene is automatically suspect. At the surface, the base of the Chicot on the

sections has been picked at the most landward edge of the oldest undissected coastwise terrace of Quaternary age. In practice, the delineation of the Chicot in the subsurface, at least on the sections in Southeast Texas, has been based on the presence of a higher sand-clay ratio in the Chicot than in the underlying Evangeline. In some places, a prominent clay layer was used as the boundary. Differences in hydraulic conductivity or water levels in some areas also served to differentiate the Chicot from the Evangeline.

The high percentage of sand in the Chicot in Southeast Texas, where the aquifer is noted for its abundance of water, diminishes southwestward. Southwest of section G-G' (Figure 8) the higher clay content of the Chicot and the absence of fresh to slightly saline water in the unit is sharply contrasted with the underlying Evangeline aquifer that still retains relatively large amounts of sand and good quality water.

RECORD OF COMMUNICATION	(Record of Item Checked Below)  X Phone CallDiscussionFiel ConferenceOther(Specify)	d Trip
TO: Julie Massey, Ecological Services U.S. Fish & Wildlife Service.	From:  Kelly Bowles, FIT Geologist  Killy Kowles	Date: 1/9/89 Time: 2:10 pm
SUBJECT: Sensitive Env	ironments along Buffalo Bayou	ļ
SUMMARY OF COMMUNICATION	<del></del>	
Q: Are there any critical	al habitats of Endangered Species or	other sensitive
environments along B	uffalo Bayou in the City of Houston?	
A: No. There are no fede	erally designated critical habaitats	for endangered
species along Buffalo	Bayou. The edges of the bayou are	fairly
industrialized, so the	nere are no federally designated sen	sitive
environments along th	ne banks.

#### **CADMIUM COMPOUNDS**

NIOSH #: EV 0260000

TOXICITY DATA:

CODEN:

ihl-hmn TCLo:1500 ug/m3/14Y-

ANYAA9 271,273,76

I:CARC

Toxicológy Review: STEVA8 2(4),341,74. Occupational Exposure to Cadmium recm std: Air: TWA 40 ug/ m3; CL 200 ug/m3/15M NTIS**.

THR: An exper CARC. The oral toxicity of Cd and its compounds is HIGH. However, when these materials are ingested, the irr and emetic action is so violent that little of the Cd is absorbed and fatal poisoning does not as a rule ensue. Cases of human Cd poisoning have been reported from ingestion of food or beverages prepared or stored in Cd-plated containers. The inhal of fumes or dusts of Cd primarily affects the respiratory tract; the kidneys may also be affected. Even brief exposure to high conc may result in pulmonary edema and death. Usually the edema is not massive, with little pleural effusion. In fatal cases, fatty degeneration of the liver and acute inflammatory changes in the kidneys have been noted. Ingestion of Cd results in a gastrointestinal type of poisoning resembling food poisoning in its symptoms. Inhal of dust or fumes may cause dryness of the throat, cough, headache, a sense of constriction in the chest, shortness of breath (dyspnea) and vomiting. More severe exposure results in marked lung changes, with persistent cough, pain in the chest, severe dyspnea and prostration which may terminate fatally. X-ray changes are usually similar to those seen in broncho-pneumonia. The urine is frequently dark. These symptoms are usually delayed for some hours after exposure, and fatal conc may be breathed without sufficient discomfort to warn the workman to leave the exposure. There is some evidence of teratogenicity. Ingestion of Cd results in sudden nausea, salivation, vomiting and diarrhea and abdominal pain and discomfort. Symptoms begin almost immediately after ingestion. A yellow discoloration of the teeth has been reported in workers exposed to Cd. Cadmium oxide fumes can cause metal fume fever resembling that caused by zinc oxide fumes.

#### **CADMIUM DIAMIDE**

mf: CdH₄N₂; mw: 144.45

Incomp: Self-explodes (water).

#### **CADMIUM DIAZIDE**

mf: CdN₆; mw: 196.44

Incomp: Explodes violently.

#### **CADMIUM DICYANIDE**

mf: C₂CdN₂; mw: 164.44

Incomp: Magnesium.

Draft After Action Report

#### AFTER ACTION REPORT

JENSEN DRIVE DRUM SITE Harris County, Houston, Texas

Site ID# K9

December 13-30, 1988

March 21 - April 21, 1989

#### I. SUMMARY OF EVENTS

#### A. Cause of the Incident:

The contamination at the Jensen Drive Drum site resulted from the poor drum handling practices of the May Cooperage Drum Reclamation Company. Approximately 400 drums were abandoned on site, 90 of which were stored inside a warehouse. Several of the drums in the warehouse were bulging. The drums on site that had been left exposed were deteriorated and leaking. Drums containing incompatible materials were stored next to each other, contributing to their subsequent deterioration. Drums were stored with open tops or without bungs. Because of the lax drum management of the drum reclamation company, a large area of soil at the east side of the site had become significantly contaminated. The May Cooperage Company ceased operations at the site during 1987.

#### B. Initial Situation:

The Jensen Drive Drum site is located at 3116 Jensen Drive in the city of Houston, Harris County, Texas. The area is a light industry and residential area. The site occupies a rectangular lot measuring approximately 400 ft. by 150 ft. There is a warehouse in the center of the site. Over 400 drums of unknown content were present on site in the warehouse and outside on the north and east sides of the site, primarily on the east side.

Historical accounts on this site are limited. However, the site was known to

be the location of the May Cooperage Drum Reclamation Co. owned by Fred Winston. A complaint by an anonymous caller prompted the Texas Water Commission (TWC) and the City of Houston to file complaints against Mr. Winston. Mr. Winston moved his operation to 3116 Jensen Drive from 1705 Davis Street, another site which is currently under EPA evaluation.

Current Harris County deed records indicate the property is owned by LEAS-IT, Inc. of Harris County, Texas. During a site assessment at the nearby Davis Street site, Mr. Winston informed EPA that a Mr. J. D. Gray owned the property. Mr. Gray is a representative for LEAS-IT, Inc.

In August 1988, a site assessment was conducted by Region VI ERB. The analysis of samples taken at that time verified the contamination and potential threat.

#### C. Efforts To Obtain Response by Responsible Parties:

There are 14 Potentially Responsible Parties (PRPs) currently identified as being involved at the site. Eleven of these are apparently generators, as their names appear on the drums found at the site.

Due to the fire and explosion threat posed at the site, verbal demands were issued. All currently known PRPs were contacted by telephone and extended the opportunity to participate in the cleanup. They were asked to provide notice by telephone to the On Scene Coordinator by 1600 hours on December 13, 1988 if they intended to participate. A follow-up letter was mailed to each PRP to confirm the telephone conversation. Should additional PRP names be revealed as the cleanup action progresses, they will be notified as PRPs.

The May Cooperage Company which operated at this site is no longer in business at this location. They were not listed with the Texas Secretary of State as a corporation. They no longer have a working telephone, nor do they appear in the local telephone directory. Mr. Fred Winston was the operator of the May Cooperage Company. He is now apparently operating another business, Worlds Finest Detergent. The property owner is Mr. R.D. Gray and/or R.J. Gray according to state records.

#### D. Organization of Response:

The Emergency Response Branch (ERB) was involved in two separate actions at the Jensen Drive Drum site, 3116 Jensen Drive, Houston, Harris County, Texas. The first action memorandum, signed December 12, 1988, was for an emergency stabilization action. The second action memorandum, signed March 15, 1989, was for a removal action.

ERB was requested to sample approximately two hundred drums, conduct hazard categorization of the drum contents to aid in their temporary segregation and the future staging and securing of the drums in the building before their final transportation to disposal, and to build a fence in order to prevent further uncontrolled access and vandalism on site in accordance with the Action Memorandum signed December 12, 1989. The ERB was requested to excavate and dispose of the contaminated soil and dispose of the empty drums and the drummed material in accordance with the Action Memorandum signed on March 15, 1989.

#### E. Resources Committed:

On December 12, 1989, the Regional Administrator authorized \$300,000 for the Emergency Response Cleanup Services Contractor (ERCS) and \$489,200 for the entire project. The Technical Assistance Team (TAT) was authorized \$32,000.

On March 15, 1989, the Regional Administrator authorized an additional \$111,000 for the ERCS and \$153,000 for the entire project. The TAT was authorized an additional \$32,000 for a total of \$64,000. The amount of funds procured through the Delivery Order for the ERCS fund was actually \$250,000. The final TAT cost was \$37,353.25 or 58% of the projected cost. ERCS final cost was ___ or __% of the Delivery Order Ceiling.

#### F. The Location of the Hazardous Substance:

Approximately 400 drums were present on site. The majority of the drums were stored outside on the north and east sides of the site. Many of the drums were empty with a small number containing less than one inch of liquid in the bottom. The warehouse contained 91 drums, 20 fiberboard barrels, 10 compressed gas cylinders and a 500 gallon polypropylene vat that was about half full. The drums were in varying stages of deterioration and some are bulging. There were extensive areas of contaminated soil on the east side of the site where leaking drums had been stored.

During the August 1988 site assessment, TAT personnel collected samples including two soils, six drums and the 500 gallon vat. CERCIA designated hazardous substances were identified in all samples. There were a number of inorganic compounds on site which can be considered toxic. Numerous organic compounds listed as hazardous substances in 40 CFR 302.4 were found. A number

of compounds considered carcinogenic were found.

G. Comments On the Effects On Natural Resources:

The OSC is not qualified to provide comment on the potential or actual effects that this site has on natural resources.

H. Efforts To Replace Or Restore Damaged Natural Resources:

ERB took no efforts to replace or restore any damaged natural resources.

I. Threat Abatement Action:

On December 13, 1989, the emergency stabilization action was initiated when the OSC, TAT and ERCS met at the site to reconfirm the scope of work and team responsibilities.

The OSC determined that a perimeter fence was necessary on site to reduce the potential for direct contact with site contaminants. A field fence as well as two strands of barbed wire was erected around the site perimeter. A ten-foot gate was put in place to secure the single entry access point. The crew combed the site to locate all the drums. Each drum was examined for content. The empty drums were staged in a separate area. Drums with less than 1 inch of material were separated. Later, field hazard categorization was performed and the compatible wastes were bulked for disposal. The OSC directed ERCS to overpack all the drums containing material due to the poor condition of the drums. The 176 drums containing material were sampled and overpacked in a Level "B" operation. TAT provided air monitoring during the operation.

Hazard categorization was performed on the drum samples, compatible drum samples were composited and the composite samples sent to the laboratory for complete analysis. The drums were staged inside the warehouse by hazard class, incompatible wastes were segregated.

A total of twelve warning signs were placed in areas of high visibility. The signs were mounted directly on the fence and the warehouse. The warehouse and the gate were secured with key locks.

On March 27, 1989, the removal action was initiated. The empty drums were prepared for future disposal. They were later transported to the disposal facility with the excavated soil. The fiberboard drums were cut into sections and the metal drums were crushed. The pre-excavation soil sampling was completed on March 9, 1989. A total of 123 tons of soil were excavated from the east side of the site down to the underlying clay layer. After the post excavation sampling was completed, 190 yards of fill dirt were used to level the area.

Hazardous waste profiles were completed upon receipt of the laboratory analysis of the drum sample composites. The contract for disposal of the drums and the soil/empty drums was approved. Personnel onsite demobilized on April 11, 1989. On April 21, 1989, the ERB remobilized to load the drums for transportation to the disposal site. The drums entered the disposal site on April 24, 1989. Final demobilization was completed on April 21, 1989.

#### J. Public Information:

On December 13, 1989, the TAT prepared a public notice of federal action. The

notices were posted in local businesses and distributed to the residences in the adjoining area.

#### II. EFFECTIVENESS OF REMOVAL

A. Actions Taken By the Responsible Party:

No actions were taken by the responsible parties.

B. Actions Taken By State and Local Forces:

The TWC and the City of Houston filed complaints against Mr. Winston about his operation of the May Cooperage Company. The TWC requested the EPA investigate the site for imminent and substantial endangerment to the public. The site does not meet requirements for a state funded removal because it does not appear to impact waters of the State of Texas.

#### C. Actions Taken By Federal Agencies:

The ERB was the only federal agency active in the clean-up activities at Jensen Drive Drum site. Two separate actions were completed at the site. The first was an emergency stabilization, the action memorandum is dated December 12, 1988. The second was a removal action, action memorandum dated March 15, 1989. The two actions are discussed separately below.

The work conducted met the objectives of the project as specified in the December 12, 1988, Action Memorandum. The fence reduces the potential for direct contact with site contaminants. The threat posed/by the leaking and

deteriorating drums was stabilized. The drums were sampled and hazard class analysis was performed. The stability of the situation was enhanced by the overpacking of the drums and the staging of the drums by hazard class for storage in the locked warehouse on site. The placement of warning signs along the newly secured fence should prevent, unwanted site entry. The signs will also educated the public about the existence of hazardous materials onsite that they previously might not have known about.

The work conducted met the objectives of the project as specified in the March 14, 1989 Action Memorandum. The areas and extent of contamination were determined. The excavation and disposal of the soil and empty drums was done in a time effective manner with minimal manpower and materials cost. The disposal of the drummed waste was managed in a cost and time effective manner. Careful planning of the transportation of the waste to the disposal facility took into consideration space availability; thus insuring no additional cost was incurred from storage of the drums. Loading of the drums was completed with minimal manpower and insured no additional cost from the storage of the drums was incurred. At the completion of the two federal actions all of the drums, drummed waste and contaminates soil on the site had been disposed of in an effective and cost efficient manner.
